

Household Energy Consumption, Emissions, Pollution, and Health Impacts in India

STATE **Uttar Pradesh**

(state and district as of census-India, 2011)

DISTRICT **Fatehpur**

Household energy consumption (HEC) emissions were calculated in four classes - cooking (CK), lighting (LG), space heating (SH), and water heating (WH). Bottom-up emissions for the four classes are available @ 0.25 degree spatial resolution, and further aggregated to district and state level. A sub-classification is available by fuel - biomass, coal, kerosene, liquified petroleum gas (LPG), and others.

%Households Primary Cooking Fuel

Estimated district annual HEC emissions

Paticulates (2.5µm)	8,160 tons
Sulfur dioxide	680 tons
Nitrogen oxides	370 tons
Carbon monoxide	120,200 tons
Hydrocarbons	15,660 tons
Black carbon (BC)	1,870 tons
Organic carbon	3,180 tons
Carbon dioxide (CO2)	0.30 mil tons

Estimated PM_{2.5}
emissions @ 0.25
degree resolution

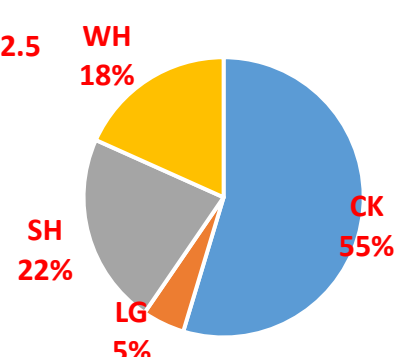

Modeled share of
HEC emissions to
ambient PM_{2.5}

DISTRICT EMISSIONS

NATIONAL EMISSIONS

**% contribution of HEC
emissions to modeled
ambient PM_{2.5}
concentrations**

(concentrations were conducted using the
WRF-CAMx models)

National	29.6%
District	36.5%

The health impacts of outdoor air pollution as ischemic heart diseases (which can lead to heart attacks), cerebrovascular disease (which can lead to strokes), chronic obstructive pulmonary diseases, lower respiratory infections, and cancers (in trachea, lungs, and bronchitis) were estimated using the age-dependent relative risk functions detailed in the Global Burden of Disease study and dispersion modeling results from this study. The final calculations were conducted at the district level using the population distribution by age presented in Census-India.

**Estimated premature
mortality of outdoor air
pollution per year -
apportioned to
HEC emissions**

National	84,000 - 115,000
District	160 - 198

Emission and dispersion modeling results, pollution animations, and summary sheets by district and state are hosted
